POWERING THE ELECTRIC FLIGHT REVOLUTION

Integrated air cooling for simplicity and light weight

Mount from above, below, or at the end of the engine

AN6 Fuel quick disconnects

Multiple power output modes:

- Shaft power on/off
- Electrical power on/off
- Burst power from battery to boost shaft power up to 100%

Amphenol Surlok Plus™ or equivalent for main bus connection  
CAN 2.0 or J1939 at 250, 500, or 1000 kbps for comms  
Sample connectors only - we'll use what works for your application

## Batteries alone can't meet the mission?

- 5-7X higher energy density than batteries
  - Transformational range while meeting energy reserve requirements
- Up to 12X faster refuel/recharge
  - More flights per day = more revenue
- No charging infrastructure required

## Turbine options too loud or too thirsty?

- 40% better fuel economy for lower DOC and carbon emissions
- Available with noise mitigation below 70 dB at 100ft or less
- Built around a certified engine & air cooling, familiar aerospace technology

## KEY FEATURES

- Primary power generation for hybrid-electric aircraft
- 600-1000+ Wh/kg Equivalent energy density
- **40%** better fuel economy than turbines, with less noise
- Uses Jet-A or biofuel substitutes = zero new infrastructure required
- Self-contained system includes engine, generator, inverter, and thermal management using air cooling
- 600V - 800V Output
- Series or parallel hybrid modes

# VH-3-185

## Quiet, Efficient, and Affordable Power for Electric Aircraft

**Modular/Scalable** - use 1 or 2 powerplants to meet total power requirements

**Broadly Applicable** - suitable for UAM eVTOL, eSTOL, eCTOL

**Quiet** - Much quieter than turbines and turbine-hybrids

**Lowest Direct Operating Costs** compared to turbine-hybrids and battery-electric

**Flexible** - Multiple potential operating modes using optional thru-shaft:  
mechanical shaft power on/off, electrical power on/off, burst power from battery  
to boost mechanical shaft power

## SIMPLE, POWERFUL, RELIABLE ON THE ROAD TO CERTIFICATION

### SPECIFICATIONS

	SI Units	SAE Units
Max Continuous E-Power	185 kW	248 hp
Max Continuous Shaft Power	185 kW	248 hp
Max Burst Shaft Power*	370 kW	496 hp
Nominal system bus voltage	600 - 800V	600 - 800V
Specific Fuel Consumption	227 g/kWh	0.37 lb/hp-h
Ambient temperature range	-40 to 50C	-40 to 122F
Ceiling for full takeoff power	3050 m	10,000 ft
Certified ceiling	6100 m	20,000 ft
Dimensions (LxWxH)	155x90x84cm	61x35x33in
Mass, dry**	295 kg	650 lb

\*Max burst shaft power depends upon battery configuration

\*\*Dry mass includes engine, generator, inverter, and thermal systems

All specifications and performance metrics are preliminary and subject to change

info@verdegoaero.com

VerdeGo Aero has operational experience with thermal systems, battery integration, electronic interface, and noise mitigation, and we are able to provide complete systems solutions to meet all your mission requirements. Our expertise includes integration of propulsor and powerplant controls using modeling and simulation to support all design decisions.
